

Overbought condition is active

VN30 performance

The VN30 index formed the closing price at 1,231 pts. Relating to foreign trading activity, supply surged with net sell value was VND135bn, mainly driven by large sell orders on VPB, MWG, and HPG.

VN30 Future chart: Overbought condition is active

VN30F2308 experienced the selling pressure near 1,240 pts area, forming three consecutive bearish candles, giving sign for the weakness of bullish momentum and the correction period has begun. However, the bullish candle on Friday covered all the selling pressure and pushing the instrument to enter the volatile trading period which is the early signal for the upcoming correction phase. Minor correction is needed in order to strengthen the current bullish move as well as overbought condition is active. Price has started to travel far from major MAs, first signal for the surge of trading activity which is not sustainable. The overbought condition has spread to weekly time frame which increases the probability for the correction. The broken 1,180-1,200 pts zone has turned around to be the intraday support level or weakly support zone. Although the bullish move is active, new long positions are not recommended due to the overbought condition.

Technical strategy

Minor correction has begun. New positions should be placed if there is the minor correction or the short-term range bound. Thus, traders should stay on the sidelines in order to capture the best bid/offer (Hourly chart).
